

Tank&Tap (Portfolio Version)

A. Business Overview

Business Name: Tank&Tap

Product/Service Offered:

A simple, mobile-friendly web app for ordering gas and water refills. It allows customers to scan a physical tank sticker to place a one-tap reorder instantly without downloading an app. It uses simple text updates instead of heavy maps to track deliveries and filters suppliers based on physical services like heavy lifting and installation. The entire system is completely free for suppliers and runs on traditional Cash on Delivery (COD) to keep things simple and lower the tech barrier for everyone.

Customer Segment/Profile:

- **Home Users (B2C):** Homemakers who run out of water or gas mid-task, struggle with lifting heavy containers, and feel unsafe or uncomfortable installing pressurized lines themselves.
- **Small Businesses (B2B):** Local eateries and food stalls that lose money and experience severe production delays when their kitchen operations or water supply suddenly grind to a halt.
- **Local Suppliers (B2B Partner):** Neighborhood water refilling stations and gas hubs that face thin profit margins and waste valuable time manually sorting daily delivery runs by street proximity.

B. Customer Discovery and Key Findings

Number of Interviews Conducted:

- **6 End-Users** (Households and Small Businesses)
- **5 Local Suppliers** (LPG Hubs)

User Key Themes and Insights:

Theme A: "Crisis-Driven Consumption"

There is a recurring pattern of "panic-ordering" shared by all interviewees. Users do not structurally manage their inventory as they only respond aggressively once full exhaustion hits.

Supporting Quotes & Observations:

- *"For LPG we have a device that tracks the pressure pero di namin madalas chichheck so we order pag ubos nalang talaga... kasi with how busy they are, di naman siya nasisilip palagi kaya talaga masakit samin kung kelan ubos dun lang kami oorder."*
- *"Wala. Decide pag ubos na. Wala siyang indication kasi wala siyang average na usage... nalalalaman na lang namin na paubos na gas pag red/orange na yung apoy sa gas stove."*
- *"The loss of gas would probably be such a pain. Whenever it gets delayed, we usually have to order takeout... We usually order when there's little to none left."*

Theme B: "The Transparency Gap"

There is deep anxiety caused by the complete lack of a reliable ETA. Whether it is a mother in Imus or a business owner in QC, the core frustration stems from not knowing when, or even if, their critical utility is coming.

Supporting Quotes & Observations:

- *"Magulo rin minsan, minsan matagal talaga... Lagi nalang namin sinasabi padeliver nalang po agad. So wala talagang time kasi we can't foresee... may times nakakaligtaan talaga rin ng supplier."*
- *"No expected delivery time, it all depends on the supplier. May times where water doesn't even arrive at all... Good to know expected delivery time. Proper communication yun lang."*

- *“Based on distance. Since malapit lang ung nagdedeliver their stock gets delivered late to prioritize longer distance clients.”*

Theme C: "Service-Value Mismatch"

This directly addresses the critical "Do you install or carry?" barrier. Users are not just looking to purchase a simple commodity (LPG/Water), they are seeking a complete service that removes the physical weight and technical hurdle of setup, container exchanging, or heavy manual labor.

Supporting Quotes & Observations:

- *“Kung meron sana importante rin yung komportable rin sana yung ibang mga tao na iinstall na yung gas, meron naman hinde. Kasi ako masasabi kong di ako komportable, di ko kabisado kung pano.”*
- *“Alam ko yung iba meron silang exchange container offer. Bibigay nila container nila na may laman in exchange sa empty container mo... I think that's also a good service to provide.”*
- *“Quick delivery, willing to help bring the supplies up the flight of stairs to our front door...”*

Supplier Key Themes and Insights:

Theme A: Adaptive Delivery Culture

Suppliers rely on flexible, area-based routing and personal negotiation to manage unpredictable conditions. Their adaptability compensates for limited infrastructure and manpower.

Supporting Quotes & Observations:

- "Segregate orders same area nearest to farthest"
- "Priority kainan"
- "Pinagsasabay sabay ko ang byahe Yung magkakalapit na area. Para isang byahe marami kaagad ang madadalhan."

- "Route Optimization (Zoning): Pinagsasama-sama ang mga order na magkakalapit... Mas mabilis itong maubos kaysa pabalik-balik."

Theme B: Operational Vulnerability

Weather, traffic, and equipment breakdowns expose the fragility of LPG delivery systems. These external factors create recurring bottlenecks that hinder reliability and consistency

Supporting Quotes & Observations:

- "Weather and condition of area"
- "Nasiraan ng pang deliver... Trapik"
- "Matinding Trapiko at Masamang Panahon... Ang biglaang ulan ay awtomatikong nagpapabagal... Kakulangan sa detalye ng Address, malabong lokasyon, walang landmark..."

Theme C: Human-Centered Service Recovery

Professionalism and empathy are central to resolving complaints. Suppliers emphasize tone, transparency, and respect, and turning potential conflicts into opportunities for customer retention.

Supporting Quotes & Observations:

- "Hindi maiiwasan ang reklamo but handle it professionally... just talk to them professionally"
- "Bago palang magsabi ang customer... mag inform ka na ng waiting time"
- "Nasa tono rin ng boses mo. Lambing sa client kung бага... explain mo yung totoo sa customer"

Theme D: Cost-Conscious Digital Resistance

While automation and monitoring are desired, high operational costs and low margins discourage investment in paid systems. Manual tracking remains the norm among small dealers.

Supporting Quotes & Observations:

- "Avail it for free. marami ng gastos ang mga LPG owners Hindi lang halata"
- "sa laki ng gastos sa LPG business di na kakayanin pa Yan. kung pwedeng libre mas maganda"
- "Due to recent regulation sa LPG industry malaki ang cost na binabayaran sa government kaya karamihan pinipili na magmanual na lang"

Theme E: Collaborative Resilience

Suppliers sustain operations through cooperation, such as borrowing stocks, using third-party riders, or cross-sourcing. This informal network builds resilience against shortages and disruptions.

Supporting Quotes & Observations:

- "Bumibili Ako sa ibang dealer para lang maserbisohan ko customer ko. Di baleng walang kita..."
- "Cross-Sourcing or Inter-branch Transfer. Humihiram ng stock... On-Demand Third-Party Logistics (3PL)... nagbu-book pansamantala sa instant delivery apps (Lalamove, Transportify...)"

C. Refined Value Proposition Canvas (VPC)

D. Before vs After Changes

Customer Understanding and Insights:

Customer Segment	Initial Assumptions (Before Customer Discovery)	Validated Reality (After Interviews)	Product & System Impact
Residential Homemakers / End Users (B2C)	Digital Search: Users search Google/Facebook for new suppliers during a crisis. Cashless Preference: Users want digital in-app payment methods. Basic Logistics: Users mostly care about basic delivery tracking.	Directory Fatigue: Some already have existing backups while some tolerate bad service because searching online is exhausting. Mostly COD: They keep cash physically ready for delivery boys. Safety Anxiety: Delivery fear is tied to physical labor, not just ETAs.	Fulfillment Filters: Built explicit filters for container exchanges and safe installation. No-Checkout Flow: Maintained a pure COD workflow, stripping out complex payment gateways (for now).
Micro/Small Business Owners (B2B)	Inventory Check: Commercial owners use structured inventory	Operational Blindspot: Kitchen crews are too busy with active	Usage-Based Nudges: Shifted tech priority toward automated external

	equipment to track usage. Digital Preference: They prefer card or digital business payments to streamline their accounting.	production loops to monitor gauges, leading to sudden, panic-inducing stockouts. Severe Downtime Costs: Running out completely doubles production time and hurts their brand. Strictly COD: They keep physical cash ready in hand for immediate doorstep payment.	push notifications to prompt busy business owners before they empty. Supplier Acceptance Net: Added an automated system timer to quickly route orders elsewhere if a primary supplier ignores the request.
Local Utility Suppliers (B2B Partner)	Adaptability: Local Utility Suppliers can adapt to Tank&Tap in 1 year with proper dissemination and partnerships. Willingness to pay: Suppliers are willing to pay a reasonable amount for access to	Cost-Conscious: Suppliers prefer to do manual monitoring; high operational costs discourage them from paying for or using premium services. Willingness to adapt: Suppliers are willing to adapt	100% Free UI: Swapped merchant subscription fees for a user-end flat delivery convenience fee. Auto-Zoning Dispatch: Automated the dashboard sorting so orders group by street area

	customer profiles and management tools.	as long as it is free or a one-time payment.	proximity instantly.
--	---	--	----------------------

Assumptions Validated, Changed, or Removed:

Categories / Core Hypotheses	Initial Assumption (Before)	Validated Reality (After)	Status / Action Taken
1. Problem Hypothesis (Delivery Anxiety)	Users experience anxiety due to slow supplier response times and unpredictable ETAs.	Logistical anxiety is real, but it is deeply worsened by physical setup anxiety (fear of unsafe LPG installation) and heavy lifting chores.	Validated & Expanded: Confirmed the logistical pain exists, but explicitly added physical labor and installation safety to the problem scope.
2. Behavior Hypothesis (Alternative Sourcing)	When a primary supplier fails, customers use informal networks (neighbors/word-of-mouth) to find backups instead of online search engines.	Users don't rely much on online search engines or social media directories because it is too exhausting. They mostly rely on local neighbors, pre-existing contact loops, or tolerating primary suppliers	Validated & Repositioned: Leveraged the entry logic. Added the Scan-to-Order QR Fast-Pass for one-tap repeat orders to match their preference for convenience, while retaining a clean

		even if it's inconvenient.	supplier selection screen with service filters only as an explicit backup option.
3. Value Hypothesis (Platform Adoption)	Automated refill reminders, real-time arrival estimates, and alternative supplier matching resolve delivery anxiety and prevent downtime.	All three features are highly desired. A business owner needs reminders, a Mother needs predictable ETAs, and both require streamlined alternative matching to prevent production delays.	Validated: Confirmed all three core features directly address real, validated customer pain points.
4. Supplier Problem Hypothesis (Manual Chaos)	Suppliers suffer from lost orders, bottlenecks, and call overload when managing peak-hour requests.	Communication loops and manual data entry are major bottlenecks. However, suppliers manage friction highly effectively through verbal negotiation, and they control chaos using structured manual area zoning.	Changed: Realized the web app shouldn't just "stop calls," but must digitize and speed up the manual proximity zoning and delay messaging habits they already use to survive.

5. Supplier Behaviour Hypothesis (Analogue Habits)	Suppliers rely strictly on raw phone calls, text threads, and physical logs/whiteboards to run daily operations.	Daily intake is purely manual ("mano-mano"). However, during rider shortages, they do use digital third-party delivery apps like Lalamove.	Changed: Built a clean dashboard to replace physical logbooks, but ensured it can easily export order details if they need to copy them into 3PL apps.
6. Supplier Value Hypothesis (Monetization/Adoption)	Suppliers will gladly onboard and pay a subscription or commission fee because the tech increases their daily capacity.	Heavy government regulation costs and thin margins make them completely refuse to pay for software overhead.	Invalidated & Shifted: Completely dropped supplier billing. Made the software 100% free for them. Shifted the ₱15 fee to the consumer COD invoice instead.
7. Trust Mechanism	Users would rely on community-sourced social reviews and ratings to select and trust local suppliers.	Users care less about social reviews and more about specific operational capabilities such as container exchanges, heavy lifting, or safe installation.	Changed: Shifted development priority away from social review features toward explicit, toggle-able Supplier Capability Filters.

Key Learnings Affecting the Business Idea:

- **Prioritizing the QR Fast-Pass Over the Directory**

Our interviews showed that customers are highly reactionary. They only order when they completely run out of gas or water. Because they overwhelmingly prefer sticking to their primary supplier to avoid hassle, speed is everything. We shifted our main value effort away from making users browse a public directory and instead focused on the **Scan-to-Order QR Fast-Pass**. One scan auto-fills their regular supplier's data for an instant, one-tap reorder.

- **Using the Directory and Filters as a Safety Net**

We did not throw away the directory, we repurposed it as an automated fallback system. Since different independent suppliers offer different physical services (some only exchange containers, while others handle heavy lifting or installations), we cannot change their business models. Instead, we use a clean **Supplier Selection Screen** with **Service Filters** so users who are ghosted by their primary vendor can instantly find an available backup who matches their exact physical labor needs.

- **Labor and Safety Guarantees Matter as Much as Speed**

Logistical anxiety is not just about tracking a driver on a map, it is also tied to the physical chores of heavy lifting and safety. Because home users feel unsafe or uncomfortable installing pressurized LPG lines themselves, features like **Supplier Capability Filters** and **Driver Proof of Safe Setup** became core requirements rather than optional app add-ons.

- **Building a Simple Code-on-Delivery (COD) Business Model**

Because both suppliers and end users mostly rely on Cash on Delivery (COD) and prefer having physical money ready upon arrival, we removed digital checkout payments from our lean launch. This required us to design a **Two-Way Delivery Confirmation** layout (the driver logs the safe setup and the customer

taps "Order Received") to cleanly track successful transactions so we can bill suppliers their performance fees later.

- **Neutralizing Digital Resistance with Free Utility Software**

The supplier responses completely shattered our plans to charge a merchant-side software fee. Because hyper-local retailers operate on thin margins and face high local compliance expenses, we pivoted to a **100% Free Operational Dashboard** for merchants. By moving the ₱15 processing fee to the end-user's COD receipt, we eliminated the supplier's onboarding cost barrier, making deployment frictionless.

- **Automating the Sorting Matrix (Zoning)**

The interviews revealed that a supplier's greatest logistical drain is manually mapping and sorting delivery sequences. They waste significant time grouping orders to ensure riders do not travel back and forth across neighborhoods. Our platform capitalized on this by turning the merchant interface into an **Automated Proximity Dispatcher** that auto-batches orders by geographical zones immediately upon incoming customer checkout

- **Embedding Proactive Delay Messaging Systems**

We discovered that suppliers routinely struggle with unpredictable road delays (floods, bad landmarks, mechanical issues). Their primary tool for damage control is transparent client negotiation to set customer expectations. We formalized this behavior by adding a quick-tap **Delay/Manpower Alert Option** to the supplier console, instantly updating the customer's countdown timer and removing manual text message loops

F. MVP Direction

Target User and Validated Problems:

End-Users (Households & Micro-Businesses)

- **Panic Stockouts:** Users run out of gas or water mid-task because checking lines manually is forgotten.
- **Delivery Guesswork:** Unpredictable timelines and missing ETAs force users to wait blindly or face downtime.
- **Setup Anxiety:** Heavy lifting and unsafe physical tank installations create deep user discomfort.

Suppliers (Independent Retailers & Dealers)

- **Administrative Burden:** Shop operators waste excessive time manually typing client logs and sorting delivery sequences.
- **Communication Overload:** Peak-hour rushes cause chaotic phone queues from customers constantly checking order status.
- **Digital Resistance:** Thin margins and high regulation costs prevent adoption of expensive monthly software.

Current Workflow (As-Is):

End-User Chain

1. **Monitoring (Manual):** User periodically checks gauge/visually inspects, which is often forgotten due to being busy.
2. **Detection (Panic):** Discovery of empty supply at the worst possible time (e.g., during cooking).
3. **Contact (Bottleneck):** Manual search for a supplier who is both available and provides the specific service needed (install/swap).
4. **Wait (Uncertainty):** User waits without ETA, leading to repeated follow-up messages.
5. **Execution (Labor):** User struggles with installation/swap process.

Supplier Chain

1. **Intake (Chaos):** Managing a messy influx of simultaneous phone calls, text messages, and Viber orders during peak hours.
2. **Logging (Bottleneck):** Writing down delivery addresses and customer data by hand into paper logbooks or notebooks.
3. **Dispatch (Inefficiency):** Manually grouping order delivery runs by neighborhood proximity using pure memory or guesswork.
4. **Tracking (Friction):** Answering repetitive follow-up updates from customers by constantly calling riders on the road.
5. **Retention (Leakage):** Losing regular customers to nearby rivals during unexpected stock or rider shortages.

Proposed Workflow (To-Be)

User Path

1. **Proactive Nudge:** Automated phone reminders prompt checks before a supply crisis happens.
2. **Instant Access:** Scanning a physical tank QR sticker auto-fills ordering details immediately.
3. **One-Tap Order:** Bypasses directory checkouts with a single tap for repeat buys.
4. **Text Tracking:** Displays clear, text-based countdown timers and milestones instead of maps.
5. **Verified Installation:** Confirms completion only when physical setups are safely completed.

Supplier Path

1. **Automated Logging:** Incoming QR orders auto-populate customer fields on the dashboard screen.
2. **Proximity Zoning:** System automatically groups order batches from closest to farthest.

3. **Quick-Tap Alerts:** Operators send instant delay notifications to users with one tap.
4. **Clipboard Shortcut:** Quick-copy tools allow instant text pasting into external delivery apps.
5. **Retention Tracking:** Digital history logs allow automated re-engagement of old clients.

Identified Features (Must Have, Should Have, Could Have)

Must Have

- **One-Tap QR Re-order (Fast-Pass):** Instant sticker-to-order routing with zero data entry for the customer.
- **Automated Refill Reminders (Usage Nudges):** Proactive smartphone alerts sent to users based on historical consumption data.
- **Service Capability Filters:** Marketplace fallback screen sorting local suppliers strictly by their physical labor offers (lifting, installation).
- **Auto-Populated Dashboard Log:** Seamless backend routing that automatically extracts buyer records from a QR scan and loads them onto the supplier screen without manual typing.
- **Proximity Zoning Matrix:** Automated dashboard dispatch logic that instantly groups incoming orders by street area proximity (sorting nearest to farthest).
- **Two-Way Delivery Confirmation:** A rider dashboard toggle combined with a user "Order Received" button to cleanly log COD transactions and track platform fees.

Should Have

- **Live Order Milestones:** Data-saving countdown timers and order status progress indicators instead of heavy GPS mapping.
- **Quick-Tap Delay Notices:** Simplified dashboard alert toggles for vendors to push instant delay notices (*traffic, weather, low stock*) directly to the client view.

- **Clipboard Copy Shortcut:** A one-click copy dashboard layout allowing suppliers to cleanly copy customer data and paste it directly into external 3PL apps like Lalamove or Transportify.

Could Have

- **Digital In-App Payments:** Integration with GCash/Maya checkouts for users who want to transition away from cash-on-delivery.
- **Supplier Ratings & Badges:** Community reviews and social proof tags (e.g., "Suki Choice") to help users trust new backup vendors.
- **Price Change Alerts:** Simple automated updates informing users if local LPG market rates fluctuate before they order.

MVP Scope Statement

Our MVP addresses Crisis-Driven Consumption by replacing reactive panic with proactive management. By closing the Transparency Gap through text-based milestone tracking and resolving the Service-Value Mismatch through requirement-based service filtering, we transform a fragmented refill process into a predictable, one-tap routine. Simultaneously, our platform neutralizes the Cost-Conscious Digital Resistance of local suppliers by delivering a 100% free order-management dashboard that automates proximity-based route prioritization and eliminates manual data-entry logs, aligning both customer convenience and merchant financial constraints.
